

COLLECTION POLICY OF THE FILM ARCHIVE OF THE NATIONAL ARCHIVES

Version: 1.0

Date: 29 March 2018

Version history:

Date	Version	Description
29 March 2018	1.0	The collection policy of the Film Archive of the National Archives has been approved under the 25 January 2018 decision of the Consultative Board of the National Archives.

The National Archives is a government agency operating under the jurisdiction of the Ministry of Education and Research. It collects, preserves and provides access to information documenting Estonian history, culture, statehood and social circumstances.

1. INTRODUCTION

The primary function of the Film Archive of the National Archives (hereinafter the Film Archive) is to preserve films, photographs, video and sound recordings important for Estonian culture, making them accessible to the public as conveniently as possible.

The collections of the Film Archive consist of three types of heritage: moving images (films and video recordings), photographs and sound recordings. In many ways, the reasons for this structure are historical. In 1936, the first predecessor of the present-day Film Archive sprang up at the State Archives – the film and photo collection, which began to collect and preserve the film production of Eesti Kulturfilm studio and photographs from correspondents of the major newspapers. Whilst plans were made to also acquire sound recordings, these were not implemented due to the breakout of the war. During the Soviet period, the medium-based setup continued, and 1971 saw the establishment of the ESSR's State Central Archives for Films, Photographs and Sound Recordings for the acquisition and preservation of these media. The principles of selection were comparatively similar both before and after the war: the focus was on material representing significant events and persons and on the output of the state media (film and TV studios, news agencies, newspapers and magazines as well as the broadcasting system and other producers of sound recordings). This involved the selective acquisition of film and TV production (all newsreels but only a portion of TV programmes and documentaries). The camera negatives of feature films and of a significant portion of animated films from the Tallinnfilm studio are preserved by Gosfilmofond in

Moscow, due to the legislation at that time. From 1989 to 1999, the organisation operated under the name of the Estonian Film Archive; from 1999, the Film Archive became a structural unit of the National Archives. During the chaotic 1990s, when the existing state institutions ceased operations or were reorganised, heritage reached the Film Archive as a result of various agreements and purchase transactions. Under the Archives Act adopted in 1998, state institutions and public law agencies became the main acquisition sources.

The collections of the Film Archive reflect the diverse history of Estonia's audiovisual culture and technology from the birth of various media to the present day. The oldest photograph dates from 1863, the earliest sound recording from 1904 and the first film from 1908. In addition to professional film production, i.e. newsreels, documentaries, feature, animated, promotional and educational films as well as outtakes and ephemera (such as editing sheets, scripts, promotional posters), the Film Archive preserves numerous amateur films but also TV production and video recordings of state institutions. Holdings from newspapers' editorial offices form the core of the photo collection. The sound collection features radio programmes, sound recordings of government agencies, and music, recorded on discs, tapes and cassettes. In addition, the collection of non-film artefacts includes photo, film and sound equipment (cameras, projectors, gramophones, magnetic tape recorders, etc.).

Moving images, photographs and sound recordings are inevitably related to specific technological conditions that evolve over time, affecting their creation and pre-archive existence as well as how they are handled – acquired, preserved and made accessible – at the archive.

Today, the Film Archive **collects** films, photographs, video and sound recordings relevant for Estonian culture and representing Estonia's history and social processes (see also the acquisition policy of the National Archives). Entered into force in 2017, the Legal Deposit Copy Act imposes on film producers operating in Estonia the obligation to deposit with the Film Archive the master elements of all the films produced by them (see also appraisal decision No. 2 of the Film Archive of 6.1.2017). Photographs, video and sound recordings reach the Film Archive from both agencies performing public functions in Estonia and as donations from private persons and private institutions.

The Film Archive **preserves** the acquired elements primarily in their original form (analogue or digital), medium (photograph, film, video or sound recording) and physical carrier (e.g. cinematographic films or magnetic tapes, video cassettes, audio discs, photographic prints, as well as negatives or transparencies on glass and film). Hence, the collections of the Film Archive encompass highly varied, often also physically fragile, objects whose handling is resource-intensive, requiring specialist knowledge, materials and equipment. The Film Archive devotes equally close attention to the preservation of works created using both new (digital) and old (analogue) technologies, serving as an important centre of competence in

both fields. Preservation is an essential function because this is the only way to ensure continued access to Estonia's audiovisual heritage in the future.

Access to the collections of the Film Archive is generally free under the Archives Act; however, the use of material at the Film Archive may be restricted by, for example, constraints imposed by the donor, conditions under the Copyright Act and the physical condition of the elements. In an increasingly digitised world, the mission of the Film Archive is to use new technologies in order to make its collections readily accessible and to actively promote Estonia's film, photo and sound heritage among all the age and stakeholder groups, regardless of their geographical location. To this end, the Film Archive uses the databases of both the National Archives (FIS, Fotis) and its collaboration partners (EFIS), but also international heritage portals (European Film Gateway) and social media (YouTube, Facebook, Instagram). At the same time, the mission of the Film Archive as a *heritage* institution is to not only safeguard the original elements, but also to keep making analogue media accessible in its intended form, for example, providing the current and future generations the opportunity to experience film heritage in analogue projection, not only in the form of digitised copies.

The Film Archive values collaboration in order to collect, preserve, and provide access to and promote appreciation of Estonian film, photo and sound heritage both in Estonia and at an international level. In order to raise public awareness and enrich Estonia's audiovisual culture, the Film Archive organises exhibitions, screenings, conferences, seminars and other events, working closely with Estonian (film) heritage, educational and research institutions such as the Estonian Film Database, the Film Museum of the History Museum, the Estonian Film Institute, the Estonian Public Broadcasting, the Centre of Excellence in Media Innovation and Digital Culture, etc. The Film Archive is also a member of various international organisations: the International Federation of Film Archives (FIAF), the Association of European Cinémathèques (Association des Cinémathèques Européennes, ACE) and the Baltic Audiovisual Archival Council (BAAC), participating in the work of the International Association of Sound and Audiovisual Archives (IASA) as an individual member.

The work of the Film Archive is guided by the Archives Act and the Archival rules, the Copyright Act, the Legal Deposit Copy Act, the Statutes of the Film Archive, as well as other legislation governing the operations of the National Archives. In parallel, the Film Archive takes into account recommendations and conclusions of the European Parliament and of the

Council¹, and is guided by various internationally recognised principles², standards and best practices³.

The purpose of the collection policy is to explain the underlying principles for the functioning of the Film Archive and its procedures both to persons and agencies coming into contact with the archive and to employees of the National Archives.

Although a number of the underlying principles set out herein are fairly permanent in nature, the operations of the Film Archive depend on various external factors. In order to take account of these, the collection policy is subject to regular review and revision. The collection policy is shaped, formulated and reviewed by the Film Archive, discussed by the Consultative Board of the National Archives and issued with an opinion by the Archives Board.

The collection policy has been approved by the Consultative Board of the National Archives on 25 January 2018.

² [FIAF Code of Ethics](#) and [IASA Ethical Principles for Sound and Audiovisual Archives](#) (2010).

³ For example, the CSN [EN 15744](#) and CSN [EN 15907](#) Standards; [The FIAF Moving Image Cataloguing Manual](#); ISO standard [10356:1996](#); recommendations of the [Image Permanence Institute](#) and the [Dublin Core Metadata Initiative](#).

2. ACQUISITION AND DOCUMENTATION

2.1 Acquisition policy

Acquisition by the Film Archive is primarily guided by the acquisition policy of the National Archives. Audiovisual works and photographs with archival value are acquired in both analogue and digital form, regardless of the medium and physical carrier. Archival value consists in evidential value or intrinsic, that is, cultural, historical, aesthetic or technological, value for reasons resulting from the object itself.

The Film Archive collaborates with other heritage institutions and takes into account their fields and policies of acquisition in its collecting activity.

2.1.1 The main objective of the acquisition activity of the Film Archive is to provide access to archival materials, as a result of which preference is given to collecting material with the minimum legal restrictions on use. In the case of the private sector, preference is given to acquisition by donation (i.e. the ownership of artefacts will be transferred to the National Archives), as opposed to deposit contracts (under which the ownership of the artefacts remains with the depositor) that are considered only under exceptional circumstances. It is important for the Film Archive that the terms and conditions of contracts concluded should not limit activities needed for the preservation of materials in its care.

2.1.2 The Film Archive collects:

- photographs, video and sound recordings with archival value, created in the course of the operations of agencies who are considered creators of archival records;
- master and/or distribution elements of films (co)produced and distributed by producers and/or distributors registered in Estonia, together with records related to the production process, under the Legal Deposit Copy Act and the appraisal decision No. 2 of the Film Archives of 6.1.2017;
- voluntary donations under gratuitous contracts;
- own footage – recordings by the staff of the Film Archive to chronicle the changing environment and events. One of the purposes for this is to document any gaps left by acquisition sources or areas whose receipt is predicted to occur in the more distant future.

FILM

2.1.3 Moving images on film base typically have archival value.

2.1.4 Archival value is attributed to films that have received production subsidy from the state as well as films completed without state support, including amateur films that record pivotal points and key persons of Estonian society, culture and history, and reflect developments in film culture, aesthetics or technology. The Film Archive also collects

advertisements that have merited recognition and student films completed as thesis projects.

2.1.5 The master and distribution elements of a film and the records related to its production process (script, designs, storyboard, music sheets, trailers, posters, photographs from the set, and crossmedia) have archival value.

VIDEO

2.1.6 When video recordings in analogue technology are collected, preference is given to the original format, since a copy always involves information losses in terms of its technical properties. If the original has not been preserved, the best, preferably first-generation, copy is acquired.

PHOTOGRAPHS

2.1.7 For acquiring photographs, an important criterion is their research value. When it comes to analogue photographs, the archive prefers to collect negatives; in the absence of negatives, prints and transparencies are also collected. In exceptional instances, where the original element of significant value cannot be acquired, the archive may also collect digital copies. Born-digital photographs are collected in their original format.

SOUND RECORDINGS

2.1.8 Appraisal of audio discs follows the recommendations set out in the National Discography of the International Association of Sound and Audiovisual Archives (IASA). Furthermore, consideration is given to the specific nature and physical carrier of the recording but also to the specific technological features characteristic of the recording method (e.g. recordings on obsolete carriers such as acetate disc, shellac disc, paper-based audio tape, etc.).

2.2 Acquisition process

2.2.1 The relations between the archive and the institutions performing public functions and film producers is regulated by the Archives Act and the archival rules, the acquisition policy of the National Archives and the Legal Deposit Copy Act.

2.2.1.1 Audiovisual elements (photographs, video and sound recordings) created by institutions performing public functions are appraised by the National Archives together with other information created by those institutions, and the institutions are required to transfer the audiovisual materials of archival value to the Film Archive.

2.2.1.2 The transfer of audiovisual material with archival value by institutions performing public functions and of film elements deposited under the Legal Deposit Copy Act is documented in a Statement of delivery and acceptance specifying the conditions of access.

2.2.1.3 In the event of a failure to perform the obligation set out in the Legal Deposit Copy Act (if the producer or co-producer does not deposit the master elements of a film within one year from when it premieres in Estonia), the National Archives as a body carrying out supervision is entitled to issue precepts and require a penalty payment of 1,500 euros.

2.2.2 Work with private persons and private organisations is regulated by the Archives Act, the archival rules and the acquisition policy of the National Archives.

2.2.2.1 The archival value of material offered to the Film Archive based on a request submitted by a private person or organisation is identified by means of appraisal based on the criteria set out in the acquisition policy of the National Archives. The result of the appraisal is documented in a substantiated appraisal decision, and if the material is found to have archival value, the archive will conclude a gratuitous contract with the donor.

2.2.2.2 The ownership of the artefacts donated to the Film Archive under a gratuitous contract is transferred to the Republic of Estonia. If the donor is the author of the work donated, the copyright holder or the holder of rights related to copyright, the subsequent status of copyright or of rights related to copyright is also agreed in the gratuitous contract. Furthermore, the donor is entitled to set access restrictions or a procedure for their use for the duration of up to 50 years from their transfer.

2.2.2.3 The transfer of materials is documented in a Statement of delivery and acceptance specifying the nature and condition of the material.

2.3 Cataloguing

2.3.1 The arrangement and metadata of elements with archival value has to be sufficient for making them accessible; the minimum set of metadata is specified in the list of the elements of archival description of the National Archives. If possible, the Film Archive is prepared to assist private organisations and persons in arranging and cataloguing elements with archival value.

2.3.2 The collections are catalogued in the AIS information system. For each film, video and sound recording, a record is created in the FIS information system, whereas photographs are catalogued in the Fotis information system.

2.3.3 In cataloguing sound recordings and photographs, the archive is guided by the metadata schema set out on the list of vocabulary terms recommended by the Dublin Core Metadata Initiative.

2.3.4 In cataloguing films, the objective is to introduce the CSN standards EN 15744 and EN 15907, which presupposes an update of the information system software.

3. PRESERVATION

The Film Archive preserves the acquired elements primarily in their original form (analogue or digital), medium (photograph, film, video or sound recording) and physical carrier (e.g. cinematographic films or magnetic tapes, video cassettes, audio discs, photographic prints, as well as negatives or transparencies on glass and film). The handling and preservation of audiovisual heritage is complex, time-consuming and costly due to the chemical and physical instability of the carriers and their machine-readability, i.e. because they require technical equipment and facilities (film projector, video player, record player, magnetic tape recorder, computer software or the like), which are prone to technological obsolescence. The objective is to maintain the working condition of equipment needed for the playback of the original carrier, thus preserving the possibility to appreciate audiovisual works in a manner close to the original method of presentation. If deterioration has advanced to a point that renders the elements inaccessible or threatens loss, the preservation of their content is ensured through digitisation.

Preservation of photo, sound and film heritage requires consistent conservation of physical artefacts and the migration of digital information, appropriate storage conditions, as well as the monitoring of environmental conditions in the storage facilities and on the working premises of the archive. Preservation is an essential function because this is the only way to ensure continued access to Estonia's audiovisual heritage in the future.

3.1 Preservation of analogue elements

3.1.1 Optimal preservation methods are chosen and implemented based on the medium, type, carrier, format, composition, mounting and finishing techniques, and, if needed, other characteristics of the elements.

3.1.2 The archival rules ([Annex 2](#)) establish the requirements for environmental conditions inside storage facilities to ensure suitable and stable interior and environmental conditions of preservation. Since the building of the Film Archive has been converted (rather than built) to serve as a storage facility and since the vaults in Rakvere have been built for the preservation of paper-based collections, the environmental conditions currently do not meet the best practice in the case of most elements (i.e. colour and black-and-white cellulose nitrate and acetate-based films and photographs, magnetic tapes and others)⁴.

3.1.3 Only staff whose duties require it are allowed to enter storage facilities. Access to and work in storage facilities are governed by the National Archives' guide for using and ensuring the security of the storage facilities and collections.

4 [Image Permanence Institute](#); [BFI Collection Policy](#). British Film Institute, 2016, p. 21.

3.1.4 Movement of elements between storage facilities and working premises, as well as any other preservation or lending activity, including conservation, cleaning, digitisation, viewing and projection, are documented. The condition of elements is inspected both before and after digitisation and lending.

3.1.5 Before moving the elements out of the vaults, they require acclimatisation in an intermediate storage facility from the temperature of the main storage facility to the temperature of the working premises over at least 24 hours before use, depending on the type of the element and the environmental conditions in the main storage facility.

3.1.6 The vinegar syndrome of the acetate base and the hydrolysis of the nitrate base occurring in film, photographs and sound recordings are subject to cross-contamination, while decomposition by-products are also triggering a decomposition process in the less deteriorated material. If a certain level of deterioration is reached, the affected element is separated into a dedicated storage facility, and options for digitisation are considered immediately.

3.1.7 In the event of accident or disaster, action is taken according to the disaster plan, fire regulations and the procedure for resolving emergencies and non-conformities.

FILM

3.1.8 The preservation elements and access elements of analogue film are stored at geographically separate locations, as a result of which allowance has to be made for transport and acclimatisation if they are used.

3.1.9 The storage of nitrate-based film and photographic elements requires special conditions set by the international standard ISO 10356:1996. The Film Archive currently lacks the environmental conditions meeting the standard or the best practice (temperature -5 °C, relative humidity 35%)⁵, as a result of which nitrate film has to be rewound every 3 to 5 years in order to reduce the exacerbation of damage and the risk of spontaneous combustion of films. The same storage conditions apply to colour film on any base and also to black-and-white acetate-based film.

MAGNETIC TAPE RECORDINGS

3.1.10 In order to avoid information losses, storage areas for all magnetic media (video cassettes, audio tapes and audio cassettes) are kept free from sources of magnetic fields.

⁵ Image Permanence Institute; The National Film and Sound Archive, Australia; BFI Collection Policy. British Film Institute, 2016, p. 21.

3.2 Conservation of analogue elements

3.2.1 The preservation process begins with the inspection and documentation of the technical and physical condition of the elements.

3.2.2 To extend the lifetime of elements:

- archival-grade materials, products and technologies are used for packaging, service and repair;
- protection of elements against mechanical, chemical, physical, biological and anthropogenic hazards (including vandalism, theft) is ensured;
- digital preservation and access surrogates are created and source elements are serviced and repaired, if needed.

3.2.3 The purpose of conservation is to stabilise the condition of an element. Conservation process has to be documented and has to be as reversible as possible.

3.2.4 Elements are packed and stored based on the arrangement scheme prepared by the donor/depositor, if possible. The use of arrangement levels helps to preserve the interrelationships between elements and the context of their creation, as well as to simplify their use and reduce the risk of damage during handling.

3.2.5 An item is deaccessioned from the collection and disposed in exceptional instances and only for extensive technical reasons (condition, defects or the like) and never for content-related reasons. Such an element is disposed only after a digital surrogate has been created (or, where possible, new analogue elements are struck), and the authenticity, reliability, integrity and usability of the content is ensured. Deaccessioning from the collection is decided in close cooperation with the conservation staff. Deaccession is documented in a deaccession report.

FILM

3.2.6 In comparison to digital media, audiovisual elements in analogue form (in particular, on polyester-based carriers) have a superior life expectancy. However, for the time being, the Film Archive does not have access to technical facilities for photochemical duplication.

3.2.7 For the safe handling of film on various equipment (viewing table, cleaning machine, scanner, projector or the like), first the existence and length of protective leaders and the condition of splices are checked, in order to prevent the splitting of film. If necessary, elements are repaired and protective leaders are attached.

3.2.8 In order to ensure the smooth and safe passage of film stock through scanner and to achieve the best digitisation result, more extensive service and repair, including film cleaning, rehydration, drying, softening treatment and the like, is carried out, if needed.

VIDEO

3.2.9 Video cassettes and protective cases are cleaned and tapes are wound to the beginning. This way, magnetic tape is protected by protective leader at the beginning of the tape. Video tapes are rewound every 3 to 5 years in order to detect any exacerbation of damage in the timeliest manner possible.

PHOTOGRAPHS

3.2.10 Generally, photographs are not removed from their original mounting (album, frame or the like). It is only warranted if it has been ascertained that the enclosures in direct contact with the photograph are damaging it.

SOUND RECORDINGS

3.2.11 Incorrect splices of audio tapes detected during technical inspection are repaired; carriers using a mechanical recording system (audio discs) are cleaned, if needed.

3.3 Digitisation

3.3.1 Analogue elements are digitised in order to

- provide access to and promote the collections of the Film Archive;
- mitigate preservation risks and prevent damage to source elements.

3.3.2 A video or film work or a sound recording is digitised in its entirety, not partially, in order to preserve its integrity and minimise the preservation risks resulting from the handling of analogue elements.

3.3.3 The Film Archive is currently equipped to digitise

- film: 8mm, Super 8;
- video: Betacam, Betacam-SP, VHS, Super VHS, VHS-C, Video8, Hi8, D8, DV, MiniDV, DVCam;
- photographs: glass plate and film negatives, prints (individual and album photos), transparencies;
- sound recordings: magnetic carriers (tapes and cassettes).

Other digitisation services can be outsourced from service providers that demonstrate proven experience in the field of cultural heritage and are approved by the archive.

3.3.4 Digitisation is done according to priorities set in the annual digitisation plan or decided on an ongoing basis as preservation needs and/or access interest become apparent.

3.3.5 In setting digitisation priorities, particular attention is devoted to so-called obsolete media, including nitrate- and acetate-based elements (photographic negatives, films) and video and sound recordings on magnetic tape (especially magnetic film sound tracks), which are irreversibly affected by advancing hydrolysis and vinegar syndrome. Elements of this kind require that a preservation surrogate has to be produced on a priority basis due to their high vulnerability, generally within 10 years from being deposited with the archive.

3.3.6 Elements are selected for digitisation subject to the following criteria:

- preservation risk, including the technological obsolescence of the reading or playback equipment;
- physical condition (existence and extent of chemical, biological or mechanical deteriorations);
- technical condition (including existence and extent of defects);
- originality (i.e. generation of film, photo, audio or video element);
- integrity (including length of film element, existence of sound track, intertitles or the like).

3.3.7 Digitisation parameters and the guidelines for processing files are set forth in the technical principles of digitisation of the National Archives, whereas the preservation formats are defined in the archival rules (Annex 1).

3.3.8 During the digitisation process, the source elements are handled with particular care in order to prevent any further damage. The condition of the elements is documented before and after digitisation; the source elements are serviced and repaired, if necessary.

3.3.9 The result of digitisation is directly related to the characteristics and the physical and technical condition of the source elements.

3.3.10 Analogue elements are not subject to deaccession simply because they have been digitised (except in the instance specified in item 3.2.5). Digitisation of analogue elements does not eliminate the need for preserving the source elements, since the development of digitisation technologies over time inevitably necessitates a return to the original material.

FILM

3.3.11 For analogue film, the digital preservation master is an uncompressed and unprocessed image sequence and an audio file. Respecting the original aspect ratio, access copies are produced from digital masters, employing a minimum of post-processing

methods, including framing, grading, colour correction, synchronisation of sound track with image sequence, and file conversion.

3.3.12 More extensive processing of files, i.e. digital restoration of films, is extremely complex and labour-intensive work that requires specialist knowledge and skills as well as specific software and hardware. The Film Archive currently has the resources for this only in exceptional instances. The process of digital restoration is fully documented. Alongside the digitally restored version, also the untreated raw scans are preserved.

VIDEO

3.3.13 Tape recordings are digitised as uncompressed video and converted into a preservation format using visually loss-less compression. The original resolution of video recordings must be preserved.

PHOTOGRAPHS

3.3.14 Digitisation method (scanning, photographing) depends on the type, characteristics, mounting and condition of source elements.

3.3.15 The aim is to generate digital surrogates in a resolution that is sufficient for high-quality printouts in A3 format (i.e. at least 5000 pixels on long dimension).

3.3.16 The resolution of digital images depends on the dimensions of the source elements (negative or print). Images are digitised in colour and saved in uncompressed preservation format (TIFF) in order to capture the maximum of image detail.

3.3.17 When digitising negatives, the image is inverted and a preservation copy is archived in positive.

SOUND RECORDINGS

3.3.18 The preservation format of digitised sound recordings is PCM (Pulse Code Modulation, WAV or BWF).

3.4 Preservation of digital elements

3.4.1 For the long-term preservation of digital elements, the National Archives employs a migration strategy. This means that digital elements are always stored in a way that allows for them to be readily used by means of currently common and widespread hardware and software. Analysis of various file formats has resulted in a list of recommended formats for long-term preservation (see the archival rules, Annex 1), into which all other file formats are migrated. International developments in support and sustainability of these formats are

monitored; if needed, the list of preservation formats is updated and files are migrated into a new format.⁶

3.4.2 Similarly to file formats, emerging preservation systems are analysed, and the currently most suitable media and the hardware needed for reading them are used. The National Archives preserves digital elements on an online disc array and on LTO tapes simultaneously.

3.4.3 Digital elements are preserved as equivalent copies in geographically separate locations. This ensures the preservation of data in case they are damaged or lost in one location.

3.4.4 Digital elements are accompanied by technical metadata, in order to facilitate the location and management of digital assets.

3.4.5 The rules for naming files are defined in the technical principles of digitisation of the National Archives.

3.4.6 Digital derived files (i.e. access and online copies) are created from the preservation format.

BORN-DIGITAL FILM AND VIDEO

3.4.7 The preservation format of born-digital films and video recordings must not be of a lower quality in terms of technical parameters (i.e. significant properties, including bit rate and resolution) than the original works. Preference is given to uncompressed non-proprietary (open source) file formats that enable loss-less migration of data into new formats in the future. Preservation formats must not be encrypted, since this makes the access to content impossible.

3.4.8 The preservation workflow starts with a technical inspection of the elements using software solutions and random visual inspection.

3.4.9 If the owner of a born-digital film or video recording lacks the capability to deposit born-digital material in the preservation format specified by the archive, the conversion of the submitted format to the preservation format is carried out by the National Archives for a fee.

BORN-DIGITAL PHOTOGRAPHS

3.4.10 Generally, the preference is to preserve born-digital photographs in their original format, in order to protect their integrity. Hence, born-digital photographs originally created

⁶ Digital archives of the National Archives, <http://www.ra.ee/en/information-management/digital-archives/>.

in compressed file format (e.g. JPG) are not converted. Exceptions include DNG and RAW formats, which are converted into uncompressed file format (TIFF).

BORN-DIGITAL SOUND RECORDINGS

3.4.11 Sound recordings in compressed format are converted into WAV format, with the significant properties of the audio file (sampling rate and resolution) kept intact.

4. ACCESS AND PAID SERVICES

4.1 Access

Herein, access refers to the consultation of the collections of the National Archives in the archives' databases and reading rooms, as well as on online platforms ([EFIS](#), [European Film Gateway](#)) and on social media ([YouTube](#), [Facebook](#), [Instagram](#)).

4.1.1 Access to the collections of the Film Archive is free, except in instances where it is limited by constraints of legislation or those imposed by the donor or depositor of the material. Furthermore, the archive may restrict access when handling of elements compromises their long-term preservation (subsection 10 (3) of the [Archives Act](#)) or if the archive lacks appropriate playback equipment.

4.1.2 The collections of the Film Archive are catalogued in [FIS](#) (films, videos and sound recordings) and [Fotis](#) (photographs) databases. Since the majority of the holdings are works the intellectual property rights of which are owned by third parties, the archive can often provide only partial (or no) online access (low-resolution preview, excerpt).

4.1.3 If digital surrogates exist but the archive is not entitled to provide online access to them, the digital copies may be consulted in the reading rooms of the National Archives.

4.1.4 Analogue elements that are not subject to an access restriction or constraints resulting from their physical condition (see item 4.1.1) may be consulted in the reading room of the Film Archive by appointment (requests should be addressed to filmiarhiiv@ra.ee).

4.1.6 Online and on-site consultation of digital copies and analogue elements is free of charge.

4.1.7 Holdings subject to an access restriction imposed by the donor or depositor can be consulted only with the authorisation of the donor or depositor, sought by the customer and provided in writing or by e-mail.

4.2 Paid services

In addition to access in the reading rooms and databases of the archives, the Film Archive offers two types of paid services for the use of its collections: providing digital copies on request and lending analogue elements for use outside the archive. The fees for these services are set out in the regulation of the Minister of Education and Research ('List of paid

services related to the use of records and the rates of fees', hereinafter the price list) under subsection 3 (4) of the Archives Act. Requests will be processed within one month.

4.2.1 In case of works in copyright, a licence fee may be charged in addition to the fee for a digital copy or the lending fee. The licence is granted by the National Archives (when the economic rights belong to the archive on the basis of law or a transaction, see subsection 10 (1¹) of the Archives Act) or the rights holder. The amount of the licence fee for the use of works with economic rights held by the National Archives depends on the purpose of their use.

4.2.2 In case of works in copyright, the archive provides digital copies and lends analogue elements with the authorisation of the rights holder, sought by the customer and provided in writing or by e-mail. Authorisation is not needed only if a private person requests a copy for personal use, without pursuing any commercial purpose (section 18 Copyright Act).

4.2.3 The Film Archive does not provide copies of items subject to an access restriction and also in the event where the archive or service providers approved by the archive do not have technical capability to generate copies.

4.2.4 Material published on the YouTube channel of the National Archives and on the European Film Gateway portal may be used free of charge and without asking the archive for permission.

4.2.5 Digital copies

4.2.5.1 Requests for digital copies are submitted in the VAU virtual reading room of the National Archives. When submitting a request, it is important to specify the reference identifiers / record numbers, the purpose of use and the party paying the invoice; in the case of films, videos or sound recordings, also the start and end points of the desired segment. In the case of films and video recordings, the archive delivers segments not shorter than 10 seconds.

4.2.5.2 Copies are delivered to the customer via the server of the National Archives after the payment of the invoice or on the basis of a letter of guarantee.

4.2.5.3 As a rule, a digital copy of a film or video recording is watermarked with the logo of the National Archives.

FILM

4.2.5.4 In case of 16mm and 35mm film elements, the Film Archive generates digital copies at various resolutions.

- Low-resolution review copy or SD copy is intended for the presentation of a work on a small screen for personal, educational or research purposes and does not reproduce the aesthetic properties of the work to the full extent. Review copies and SD copies are not suitable for the re-use of works in the film or TV industry.
- HD or 2K copy reproduces the aesthetic properties of a work to a significantly greater extent, is intended for the presentation of a work on TV or cinema screens and is suitable for the re-use of works in the film and TV industry.

4.2.5.5 The delivery of digital copies of 16mm and 35mm film elements depends on whether the archive already holds a digital copy, or not, and at what resolution.

- If a high-resolution (HD, 2K) copy of the film exists at the archive, the customer can order a copy at the suitable resolution (review copy, SD, HD, 2K).
- The price of a digital copy of a film depends on the resolution of the deliverable (see the price list, items 1.3.1 to 1.3.4) and the actual time spent on processing files (studio hour, see the price list, item 1.3.8).
- If no digital copy exists at the archive or if the resolution of the existing copy does not meet the customer's needs, the customer may request the digitisation of the film from a service provider approved by the archive.
 - To minimise preservation risks, films are digitised only as entire works rather than in portions or segments.
 - In case of a sound film, both image and sound track need to be digitised.
 - The digitisation of films and sound tracks entails additional fees for the preparation of elements (both image and sound tracks) for digitisation (see the price list, items 2.3 to 2.5).

4.2.5.6 As a rule, digital copies of 8mm film elements are delivered at HD resolution.

4.2.5.7 A digital copy available at the archive is delivered to the rights holder of the digitised film free of charge for the first time, and subsequently accordingly for the fee set out on the price list of the National Archives (see the price list, item 5.1).

4.2.5.8 The price of a digital copy of a still image from an analogue film depends on whether the archive already holds a digital copy of the film and at what resolution.

- If a digital copy of a film exists at the archive, a still at the best resolution possible (review copy, SD, HD, 2K) is delivered to the customer for a fee specified in item 1.2.2 of the price list; in addition, a fee is charged for processing the film file based on the time actually spent (studio hour).
- If no digital copy exists at the archive or if the resolution of the existing copy does not meet the customer's needs, the customer is charged for the digitisation of the entire

film (see item 4.2.5.5 of this policy), since the digitisation of individual stills is not technically possible at the moment.

BORN-DIGITAL VIDEO AND FILM

4.2.5.9 The delivery format of digital copies of video recordings and access copies of born-digital films depends on the customer's needs in terms of resolution (review copy, SD, HD, 2K) and the software applications available to the archive.

4.2.5.10 The price of a copy (including still images) depends on the resolution of the requested deliverable, the length of the segment and the time spent on processing files (see the price list, items 1.3.1 to 1.3.4, 1.3.8 and 1.2.2).

4.2.5.11 The rights holders can request a copy of the master elements of born-digital films free of charge during five years from depositing the works to the archive (subsection 14 (11) of the Legal Deposit Act) and subsequently for the fee set out on the price list of the National Archives (see the price list, item 5.1).

PHOTOGRAPHS

4.2.5.12 The technical parameters of a digital copy of a photograph depend on the original form of the photograph (analogue or digital), as well as on whether a digital copy of the photograph exists at the archive.

- As a rule, digital copies of analogue photographs already available at the archive are delivered in TIFF format and at the best resolution possible.
- If no digital copy of an analogue photograph exists at the archive or if the resolution of the existing copy does not meet the customer's needs, the customer can request the digitisation of the photograph according to the necessary technical parameters and the technical facilities of the archive.
- Copies of born-digital photographs are delivered in the format in which they are being preserved by the archive.
- The price depends on the size of the photograph (see the price list, item 1.2.2).

SOUND RECORDINGS

4.2.5.13 Digital copies of sound recordings on analogue carriers are delivered in WAV format.

4.2.5.14 A copy of born-digital sound recording may be delivered also in some other common format, considering the needs of the customer.

4.2.5.15 The price of a digital copy depends on the duration of the sound recording (see the price list, item 1.4.1).

4.2.6 Loans of analogue elements

4.2.6.1 The Film Archive lends analogue film elements (for screening and digitisation) and, exceptionally, audio tapes (for digitisation) and photo albums according to item 6 of the price list. Audio discs and individual photographs are not lent.

4.2.6.2 Lending requests have to be submitted at filmiarhiiv@ra.ee. A loan is documented in an archival records loaning certificate.

4.2.6.3 Generally, film prints are lent for screening with written authorisation of the rights holder (the depositor in case of a deposit), which is sought by the customer. No authorisation is needed only if the work is presented at an educational institution directly in the process of instruction and on the condition that the audience consists of the teaching staff and students or other persons who are directly connected with the educational institution (section 22 of the Copyright Act).

4.2.6.4 The archive considers the following criteria when making decisions on lending film prints for screening:

- physical and technical condition of the elements: the archive may refuse to lend if the physical condition of the elements is poor and/or if screening compromises their long-term preservation (subsection 10 (3) of the Archives Act);
- number of prints: a film is lent for screening only if multiple prints exist, with the most suitable one (i.e. the one that is more complete, in a better condition, with fewer defects) chosen from among them;
- if only a single print of a film exists, it can be loaned out only with the authorisation of both the rights holder and the management of the Film Archive;
- reliability and competence of the borrower: the archive lends prints to persons and organisations who are able to ensure the safe and technically correct presentation of films (e.g. equipment suitable for screening archival films, competent projectionist; correct projection speed for silent films).

4.2.6.5 The master elements of a film (original negative, sound negative, duplicate negative and duplicate positive, and magnetic sound track) are lent only for digitisation either to the rights holder or, with written authorisation of the rights holder, to third parties.

4.2.6.6 When analogue film elements are lent for screening or digitisation, the costs of preparation (see the price list, items 2.2 to 2.5), appropriate packaging and transport are covered by the borrower. Packaging (according to the recommendations of the archive, see subsection 29 (4) of the Archival rules) and transport are arranged by the borrower.

4.2.6.7 The borrower undertakes to:

- ensure the use of elements according to the purpose for which they are lent;
- ensure the preservation, arrangement and subsequent usability of elements;
- prevent elements from coming into the possession of third parties (subsection 36 (4) of the Archival rules).

4.2.6.8 The borrower is liable for non-compliance with the preservation requirements and also for the loss or destruction of or damage to elements in accordance with the applicable legislation. In the event of loss or destruction of or damage to an element, the borrower has to indemnify the costs of its reinstatement. If the element can be repaired, the borrower covers the costs thereof according to a cost estimate, or if no repairs are possible, the borrower covers the costs of acquiring a new element.

4.2.6.8 Detailed lending rules are set out in the National Archives' guide for using and ensuring the security of the storage facilities and collections.
